

Mandatory Assignment 1 – Portfolio

GitHub link :<https://github.com/StephaneIII/MyCV>

Criteria	Why it matters	Weight (%)	Bootstrap (1–5)	Tailwind (1–5)	Bulma (1–5)
Ease of Learning	Makes you start what needs to be done earlier	10	5	2	3
Customization Flexibility	The possibility to make your design unique	20	3	5	3
Documentation & Community	Easier troubleshooting and better support	20	5	5	4
Development Speed	programming more efficiently	25	5	3	4
Performance / Bundle Size	Faster loading and better user experience	10	3	4	4
Pre-built Components	Reduces UI development by reusing standard components	15	5	2	4

Framework	Score (1-5)
Bootstrap	4,4
Tailwind	3,70
Bulma	3,65

If I had to choose a framework for my next project, I would choose Bootstrap.

Although Bootstrap offers less customization than Tailwind CSS and Bulma, it makes up for this with its extensive collection of pre-built components. These components allow developers to build user interfaces quickly, which is why Bootstrap scores very well in development speed.

The documentation and community support are strong for all three frameworks, making it easy to find tutorials, examples, and solutions to common problems. While Bootstrap doesn't perform as well as Tailwind CSS in terms of bundle size and optimization, this difference is often less significant for many web applications and websites.

I assigned a relatively low weight (10%) to ease of learning because it is mainly a short-term problem. Once a developer becomes familiar with a framework, its learning curve becomes less important compared to factors such as development speed, available components, and long-term productivity.

Overall, Bootstrap has the best balance between ease of use, development speed, community support, and available components. For these reasons, it would be my preferred choice for a future web development project.

AI

I used AI to help me programming on the css file to make my web application look better and to help me use Tailwind CSS and Sass
